## BAB 1 DESKRIPSI PROGRAM

Permainan kartu 24 adalah permainan kartu aritmatika dengan tujuan mencari cara untuk mengubah 4 buah angka random sehingga mendapatkan hasil akhir sejumlah 24. Permainan ini menarik cukup banyak peminat dikarenakan dapat meningkatkan kemampuan berhitung serta mengasah otak agar dapat berpikir dengan cepat dan akurat. Permainan Kartu 24 biasa dimainkan dengan menggunakan kartu remi. Kartu remi terdiri dari 52 kartu yang terbagi menjadi empat suit (sekop, hati, keriting, dan wajik) yang masing-masing terdiri dari 13 kartu (As, 2, 3, 4, 5, 6, 7, 8, 9, 10, Jack, Queen, dan King). Yang perlu diperhatikan hanyalah nilai kartu yang didapat (As, 2, 3, 4, 5, 6, 7, 8, 9, 10, Jack, Queen, dan King). As bernilai 1, Jack bernilai 11, Queen bernilai 12, King bernilai 13, sedangkan kartu bilangan memiliki nilai dari bilangan itu sendiri. Pada awal permainan moderator atau salah satu pemain mengambil 4 kartu dari dek yang sudah dikocok secara random. Permainan berakhir ketika pemain berhasil menemukan solusi untuk membuat kumpulan nilainya menjadi 24. Pengubahan nilai tersebut dapat dilakukan menggunakan operasi dasar matematika penjumlahan (+), pengurangan (-), perkalian (×), divisi (/) dan tanda kurung ( () ). Tiap kartu harus digunakan tepat sekali dan urutan penggunaannya bebas. (Paragraf di atas dikutip dari sini:

https://informatika.stei.itb.ac.id/~rinaldi.munir/Stmik/2015-2016/Makalah2016/MakalahStima-2016-038.pdf).

MAKE IT 24

## BAB 2 ALGORITMA PROGRAM

Program ini menggunakan algoritma brute-force untuk mendapatkan semua solusi yang dapat membentuk nilai 24 dari 4 kartu masukan dengan operator tambah penjumlahan (+),

pengurangan (-), perkalian (×), divisi (/) dan tanda kurung ( () ). Langkah-langkah yang yang digunakan pada program yaitu:

- 1. Program menerima masukan dari *user* lalu divalidasi dan dilakukan pembacaan/parsing dari format input menjadi vector yang dapat diproses program.
- 2. Sebelum menemukan selurus solusi yang mungkin, program melakukan pra-proses untuk mencari permutasi dari operasi matematika dengan jumlah operan 1, 2 dan 3.
  - a. contoh jumlah operan 1: "1" atau "Q"
  - b. contoh jumlah operan 2 : "(Q \* 1)", "(9 2)", atau "(5 / 2)"
  - c. contoh jumlah operan 3: "A (9 \* Q)", "(2 4) / 5", atau "(1 + 2) / 9"
- 3. Semua kemungkinan operasi dari pra-proses akan disimpan ke dalam *map* dengan key bertipe string operasi dan menyimpan nilai dari operasi sesuai dengan key. Proses dilakukan secara berurutan dari jumlah operan 1 hingga 3, setiap kenaikan jumlah operan (operasi matematika) akan dilakukan pembentukan string baru sesuai dengan operasi yang dilakukan dan nilai dari operasi disimpan ke dalam map sesuai
- 4. Setelah melakukan pra-proses, akan ditentukan solusi dengan mengevaluasi dari semua kemungkinan operasi matematika dengan jumlah operan 4 dan menghasilkan nilai 24. Operasi dengan jumlah operan 4 didapat dari melakukan operasi antara hasil dari operasi matematika operan 2 dengan operan 2, operan 1 dengan operan 3 dan sebaliknya.
- 5. Hasil operasi akan disimpan ke dalam map dengan key bertipe string yang merupakan operasi matematika yang menghasilkan nilai 24. Penggunaan map bertujuan menghindari terjadinya pengulangan pada operasi pada kasus masukan kartu dengan nilai yang sama, contoh: "6 6 6 6".
- 6. Terakhir, program akan menampilkan jumlah semua solusi dan menampilkan seluruh solusi pada terminal. Terdapat opsi untuk menyimpan solusi pada file.

Pada algoritma ini, semua solusi unik dengan mengabaikan sifat komutatif pada operasi matematika  $(a + b) \neq (b + a)$  atau  $(a * b) \neq (b * a)$
